CATALOG #SC-1103

KWS Manufacturing Company, Ltd. was founded in 1972 to manufacture and sell screw conveyors and other bulk material handling equipment. KWS quickly became recognized as a key supplier of standard and specialty equipment for a variety of industries. The plant and facilities are currently a combined 125,000 square feet. KWS provides complete engineered systems, screw conveyors and feeders, shaftless conveyors, vertical screw conveyors, bucket elevators, live bottom bins, elevator buckets, Dragon-Flite conveyors, hoppers, belt conveyors, hollow-flite screw processors and screw pumps.

INCLINED SCREW CONVEYORS

INTRODUCTION

The engineering section of this catalog was compiled to aid you in the design of a conveyor system, yielding optimum performance and efficiency, for your individual conveying function.

Primary considerations for the selection of a screw conveyor are:

1. Type and condition of the material to be handled, including maximum particle size, and, if available, the specific bulk density of the material to be conveyed.
2. Quantity of transported material, expressed in pounds or tons per hour.
3. The distance for which the material is to be conveyed.

In the next pages is the necessary information for the selection of a screw conveyor system, presented in a series of five steps. These steps are arranged in logical order, and are divided into separate sections for simplicity.

The five steps are:

1. Establishing the characteristics of the material to be conveyed.
2. Locating conveyor capacity (conveyor size and speed) on capacity tables.
3. Selection of conveyor components.
4. Calculation of required horsepower.
5. Checking of component torque capacities (including selection of shaft types and sizes).

All necessary calculations are expressed in graphic and equation form, and use of all charts, graphs, etc. will be explained fully at the end of each section.

Engineering data regarding the design of screw feeders and their selection, is presented in a separate section, immediately following the screw conveyor data.

Any unusual applications, or special designs, should be referred to KWS Mfg's. Engineering Department.

MATERIAL CHARACTERISTICS

The Material Tables on the following pages contain information regarding materials which may be effectively conveyed, using KWS Manufacturing Company's screw conveyor systems. For information on unlisted materials, refer to the Engineering Department of KWS Manufacturing Company, Inc.

"Conveyability" data for unlisted materials can, when necessary, be compiled by making a comparison of listed materials which have similar physical characteristics, such as weight and particle size. The following is a brief description of the information presented in the Materials Table.

MAXIMUM PARTICLE SIZE

Conveyor size, speed, and horsepower requirements, are directly affected by bulk density and internal friction, which are relative to the particle size of conveyed material.

AVERAGE WEIGHT PER CUBIC FOOT

This section of the Materials Table is supplied to enable you to convert the required capacity in pounds or tons per hour to volume in cubic feet per hour.

NOTE Since most typical applications of screw conveyors receive slightly aerated, gravity fed products, the weights listed in this table are averages and when possible, actual bulk densities should be used.

CONVEYOR LOADING

The recommended percentages of conveyor loading is a prime factor in determining the size of conveyor, and is based on the maximum depth at which materials will flow through the conveyor without causing undue wear. Considerations should be made, for example, for materials with a high abrasiveness because wear indexes would normally be higher due to a larger contact area with component parts.

HORSEPOWER FACTOR

The horsepower factor, representing the relative mobility of the material, is necessary for horsepower calculation.

RECOMMENDED COMPONENT SERIES

This information is presented to assist in the selection of the proper materials of construction, component weights and other specifications best suited for the material to be conveyed. The alphabetical code refers to general component series, and the numerical code gives bearing and shaft type recommendations. See component series tables

ABRASIVENESS, CORROSIVENESS AND "FLOWABILITY"

In addition to the above information, the Materials Table also presents graphically the relative abrasiveness, corrosiveness and "flowability" of the materials listed. These characteristics, as well as other special aspects of materials, are given further treatment in the Component Selection Section. The values of the graphic presentation used in the Materials Table are listed below.

Description	I	II	III
Abrasiveness	Not Abrasive	Mildly Abrasive	Highly Abrasive
Corrosiveness	Not Corrosive	Mildly Corrosive	Highly Corrosive
Flowability	Free Flowing	Relatively Free Flowing	Sluggish
	Angle of Repose		
	To 30°	30° - 45°	Beyond 45°

NOTE Some materials, while they are not corrosive under "normal" conditions, may become corrosive under certain other conditions, such as when heated or in the presence of moisture.

SPECIAL CHARACTERISTICS NOTES

Notable unusual material characteristics are listed by numerical codes in the last column of the table where applicable. An explanation of these numerical codes is given below.

- 1 - Contains explosive dust.
- 2 - Fluidizes easily
- 3 - Absorbs moisture.
- 4 - Usage or value affected by contamination.
- 5 - Emits toxic fumes or dust.
- 6 - Usage or value affected by material degradation.
- 7 - Exceptionally light or fluffy.
- 8 - Tends to pack under pressure.
- 9 - Fibrous material which tends to mat.
- - Consult KWS Mfg. Engineering Department.

CAPACITY

A capacity table is provided on page 19 to aid you in calculation of proper conveyor size. To use this table, find the capacity at maximum RPM, opposite the recommended percentage of conveyor loading, that equals or exceeds the capacity of material required per hour. The recommended conveyor diameter will then be found in the appropriate column on the same line, as will the maximum particle size recommended for the screw diameter.

If the maximum particle size you plan to convey is larger than the maximum recommended particle size for the conveyor you've chosen from the table, you must then select a larger conveyor, adequate to handle the maximum particle size you intend to use.

CALCULATION OF CONVEYOR SPEED

Conveyor speed can be most conveniently calculated, by use of the nomographs supplied on pages To use this nomograph first locate the two known values (screw diameter, and required capacity, in cu. ft. per hour) then with a straight edge connect these two points, and the appropriate conveyor speed will be the intersection point on the third value column marked "speed".

Maximum economical capacities will be listed for reference opposite their respective conveyor diameters, and should not be exceeded. Another method of calculating conveyor speed is:

$$CS = \frac{CFH}{CFH \text{ at 1 RPM}}$$

Equation Symbols

- CS = Conveyor Speed
CFH = Capacity in Cubic Feet per Hour

CAPACITY FACTORS FOR SPECIAL PITCH OR MODIFIED FLIGHT CONVEYORS

Special conveyor types are selected in the same manner as standard conveyors, but the section capacity used for determining size and speed, must be modified to

compensate for different characteristics of special conveyors.

Calculation of special screw conveyor capacities is as follows:

$$SC = CFH \times CF$$

Equation Symbols

- SC = Selection Capacity
CFH = Required Capacity in Cubic Feet per Hour
CF = Capacity Factor

SPECIAL CONVEYOR PITCH CAPACITY FACTORS

Pitch	Description	Capacity Factor
Standard	Pitch = Diameter	1.00
Short	Pitch = 2/3 Diameter	1.50
Half	Pitch = 1/2 Diameter	2.00
Long	Pitch = 1-1/2 Diameters	0.67

SPECIAL CONVEYOR FLIGHT CAPACITY FACTORS

EXAMPLE:

A conveyor is required to transport 10 tons per hour of a material weighing 62 pounds per cubic foot and having a maximum particle size of 100 mesh. To further complicate the problem, we will require that the material be mixed in transit, using cut and folded flights. Since the distance the material is to be conveyed is relatively short, we want to use short pitch screws, to insure proper mixing of material. The materials table recommends a loading percentage of 30% A.

Actual calculated volume:

$$\frac{20,000 \text{ lbs.}}{62 \text{ lbs./cu. ft.}} = 323 \text{ cu. ft./hr.}$$

For proper calculation of size and speed, this volume must be corrected, by use of capacity factors, to compensate for cut and folded, and short (2/3) pitch flights.

These capacity factors, taken from the preceding charts are:

$$\begin{aligned} \text{Cut and folded flights 30\% loading} &= 3.75 \\ \text{Short pitch flights (2/3 pitch)} &= 1.50 \end{aligned}$$

With capacity factors included, capacity will now be calculated:

$$\begin{aligned} \text{SC} &= 3.75 \times 1.50 \times 323 \\ \text{SC} &= 1817 \text{ cu. ft.} \end{aligned}$$

This selection capacity value will be used in the capacity table, for calculating correct size and speed. In the appropriate column, under 30% A loading, we find that a 14" conveyor, at the maximum recommended speed will convey 2194 cu. ft. per hr. or 21.1 cu. ft. per revolution.

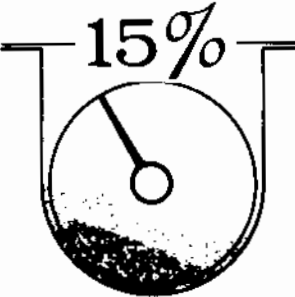

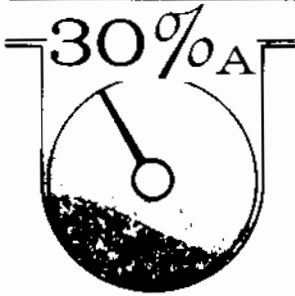

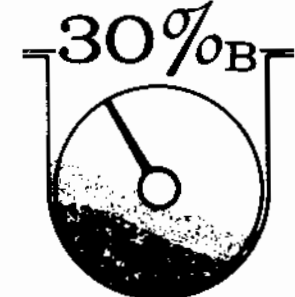

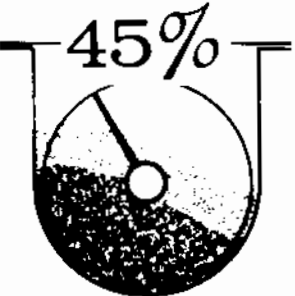

To calculate actual conveyor speed, the following formula should be used:

$$\frac{1817 \text{ cu. ft./hr.}}{21.1 \text{ cu. ft./hr. at 1 RPM}} = 86.1 \text{ RPM}$$

This is the correct speed at which the 14" conveyor with cut and folded, and short pitch flights will convey the actual capacity of 323 cu. ft. per hour.

Graphic selection of this conveyor could also be accomplished by use of the 30% A nomograph on page 22 and the selection capacity of 1817 cu. ft. per hour.

CAPACITY TABLE

Trough Loading	Screw Dia.	Max. Lump Size (In.)	Max. RPM	Capacity in Cu. Ft. Per Hr.

95%

95% LOADED CONVEYORS

Conveyor loadings may sometime exceed the recommended % of Loading, listed in the materials table. Considerations as to the material characteristics may justify up to 95% loading of tubular or shrouded conveyors. The following table lists maximum speeds limited with regard to the percentage of loading normally recommended for the specific listed materials.

**CAPACITY TABLE
FOR 95% LOADED CONVEYORS**

Screw Dia.	Max. Lump Size (IN.)	Max. Recommended RPM				Capacity in Cubic Feet Per Hour

* From the materials table

COMPONENT SELECTION

Proper selection of components is very important in the design of conveyor system. This section of the Engineering Catalogue explains the different designs of primary components, and their principle uses. Also, there is a list of special influencing factors for materials with special handling characteristics.

CONVEYOR LOADING AND DISCHARGE

Conveyor loading should be regulated to prevent the components from exceeding their design limits.

REGULATED OUTPUT DEVICES

When delivery to conveyor is from machinery with a regulated material output, the conveyor itself can be designed to handle the anticipated material volume.

Material is sometimes stored and released intermittently. In this situation, surge loads sometimes cause the conveyor to operate beyond it's recommended capacity. Screw feeders are very effective in regulating these intermittent loads, and should be used if at all possible. Otherwise conveyors must be designed for the maximum momentary or surge loads.

STATIC STORAGE LOADING

When loading from static storage or from manually regulated inlets, a load indicating ammeter can be attached to the meter control, as a simple and effective tool for accomplishing maximum design loading.

MULTIPLE INLET LOADING

When more than one inlet is feeding the screw conveyor, care must be taken to insure the collective total of the inlets does not exceed the conveyors design limits.

LOADING THROUGH AUTOMATIC CONTROLS

Automatic devices are available to modulate inlet or feed devices to work within design limits of the conveyor at all times.

DISCHARGE METHODS

Below are drawings of standard discharge components in a variety of designs. These configurations are listed for individual applications where the standard dis-

charge spouts are not necessarily appropriate. Cautions are inserted when necessary for particular discharge components.

Flush End Discharge

Standard Discharge Spout

This component provides a means of directly coupling most interconnecting spouts, processing machinery, other conveyors or storage facilities. Available with hand, rack and pinion or air actuated cut off gates.

Mechanically Operated Gates (Manual or Remote Controlled)

CAUTION

Not to be used on last discharge.

FACTORS INFLUENCING MATERIALS OF CONSTRUCTION OR SPECIAL MECHANICAL ARRANGEMENT OF SCREW CONVEYOR COMPONENTS

Corrosive Materials

Corrosive materials, or materials which have a tendency to become corrosive under certain conditions, may necessitate the use of corrosion-resistant alloys such as stainless steel.

Abrasive Materials

Abrasive materials which may cause excessive wear of components should be conveyed at a nominal depth in the conveyor. It is often advisable to also specify KWS's Abrasion-Resistant Screw Conveyors or conveyors with flights formed of AR steel plate.

KWS's Abrasion-Resistant Screw Conveyors, which have a Rockwell C hardness of 68-70, are covered in the Component Section. A table listing the standard width of application of hard surfacing is included.

Contaminable Materials

Materials whose usefulness or value may be altered by contamination may require the use of non-lubricated bearings, as well as a tightly sealed system.

Hygroscopic Materials

Materials that readily absorb moisture require a tightly sealed conveyor. It may be necessary also to jacket the conveyor trough or housing with a circulating medium

to maintain an elevated temperature. Purging the system with dry gas or air may be necessary.

Interlocking Materials

Materials which tend to mat or interlock are sometimes effectively conveyed by using special devices to load the conveyor.

Fluidizing Materials

Some materials tend to assume hydraulic properties when aerated or mechanically agitated. Such materials may "flow" in the conveyor much the same as a liquid. These materials should be referred to KWS's engineering department for recommendations.

Explosive Materials

Dangerous explosive materials can be handled by sealing the system and/or the use of non-sparking components. It is also possible to utilize exhaust systems for hazardous dust removal.

Materials Which Tend to Pack

Materials that tend to pack under pressure can frequently be handled by using aerating devices (for fine materials) or special feeding devices (for large or fibrous particles).

Viscous or Sticky Materials

Viscous or sticky materials are transported most effectively by ribbon conveyors.

Degradable Materials

Materials with particles that are easily broken may be effectively handled by selection of a larger, slower conveyor.

Elevated Temperatures

Materials handled at elevated temperatures may require components manufactured of high-temperature alloys. If it is feasible to cool the material in transit, a jacketed trough used as a cooling device may also be employed.

Toxic Materials

Materials which emit harmful vapors or dusts require tightly sealed systems. Exhaust devices may also be used to remove the vapors or dusts from the conveyor housing.

DESCRIPTION OF COMPONENTS

Conveyor Screws

The recommended screws listed in the Component Series Table are standard KWS helicoid and sectional screw conveyors. The use of helicoid or sectional conveyors is largely a matter of individual preference.

It is advisable to use, whenever possible, standard conveyors in standard lengths. When a special short length must be used to make up the total conveyor length, it is preferably located at the discharge end.

Screw conveyors are structurally reinforced at the ends by the use of end lugs which are welded to the non-carrying side of the flights so that material flow will not be obstructed.

Screw conveyors which move material in a single direction should not be turned end-for-end unless the direction of screw rotation is reversed. Likewise, the direction of rotation should not be reversed unless the conveyor is turned end-for-end. Requirements for reversible conveyors should be referred to KWS's Engineering Department. Flighting should be omitted at the final discharge, so that material will not carry past the discharge point.

To assure proper material flow past hanger bearing points, flight ends should be positioned to each other at 180 degrees.

The "hand" of a conveyor, in conjunction with the direction the conveyor is rotated, determines the direction of material flow. The diagram below illustrates flow direction for "right-hand" and "left-hand" conveyors when rotated clockwise or counterclockwise.

A right-hand screw conveyor pulls the material toward the end which is being rotated clockwise. The direction of flow is reversed when the direction of rotation is reversed.

A left-hand conveyor pushes the material away from the end which is being rotated clockwise. Again, the direction of material flow is reversed when the direction of rotation is reversed.

To determine the hand of a conveyor, observe the slope of the near side of the flighting. If the slope is downward to the right, the conveyor is right-hand. If the slope is downward to the left, the conveyor is left-hand. Right-hand conveyor is furnished unless otherwise specified.

Troughs and Tubular Housings

KWS troughs and tubular housings are available in standard lengths. Special lengths are available when required. All conveyor troughs or tubular housings should be supported by flange feet or saddles at standard intervals. Extreme end flanges should be supported with feet so that the conveyor ends may be removed without disturbing trough or housing alignment.

Inlets and Discharges

The proper methods of conveyor loading and discharge were covered previously in this section.

Shafts

The primary consideration in determining the type and size of coupling and drive shafts is whether the shafts selected are adequate to transmit the horsepower required, including any overload. Normally, cold-rolled shafts are adequate. However, high-tensile shafts may

be required due to torque limitations. Also, stainless steel shafts may be necessary when corrosive or contaminable materials are to be handled. Conveyors equipped with non-lubricated iron hanger bearings require hardened coupling shafts, and hard-surfaced hanger bearings require hard-surfaced shafts. Specific shaft size determination is covered in the Torque Capacities Section.

Shaft Seals

Several conveyor end seal types are available to prevent contamination of the conveyed material or to prevent the escaped of material from the system.

Bearings

Hanger Bearings - The purpose of hanger bearings is to provide intermediate support when multiple screw sections are used. Hanger bearings are designed primarily for radial loads. Adequate clearance should be allowed between the bearings and the conveyor pipe ends to prevent damage by the thrust load which is transmitted through the conveyor pipe. The hanger bearing recommendations listed in the Component Series Table are generally adequate for the material to be handled. Often, however, unusual characteristics of the material or the conditions under which the conveyor must operate make it desirable to use special bearing materials. A list of available special bearing materials is provided in this section. For specific recommendations regarding the use of special bearing materials, consult KWS's Engineering Department.

End Bearings - Several end bearing types are available, and their selection depends on two basic factors: Radial load and thrust load. The relative values of these loads determines end bearing types.

Radial load is negligible at the conveyor tail shaft. However, drive ends (unless integrated with the conveyor end plate) are subject to radial loading due to overhung drive loads, such as chain sprockets or shaft-mounted speed reducers.

Thrust is the reaction, through the conveyor screw or screws, resulting from movement of the material. Therefore, the end bearing must prevent axial movement of the screw which would allow contact with hanger bearings or ends. Thrust bearings should be located at the discharge end of the conveyor. This places the conveyor in tension, preventing deflection

in the screws when the system is heavily loaded. The following diagrams illustrate discharge and inlet end positions of the thrust bearing.

COMPONENT SERIES

The recommended Component Series for the material to be conveyed may be found in the Materials Table at the beginning of the Engineering Section. The alphabetical code relates to the general component series, and the numerical code refers to bearings and coupling shafts. The Component Series Table follows on the next page. Bearing and coupling shaft recommendations are listed in the table below. The Component Series Table lists the screw conveyor numbers for both helicoid and sectional screws and gives the trough and cover thicknesses. The Bearing and Coupling Shaft Table lists the recommended materials of construction.

Series	Coupling Shaft	Bearing Material
1	Standard or High Torque	Babbitt Wood Bronze
2	Standard or High Torque	Babbitt Wood Bronze Ball
3	Standard or High Torque	Babbitt
4	Hardened or Hard Surfaced	Hard Iron Hard Surfaced

Other Bearing Materials Available

Graphite Bronze
 Graphite-Impregnated Plastic
 Machined Nylon

Molded Nylon
 Oil-Impregnated Bronze
 Plastic, Laminated Fabric-Base
 Teflon

HORSEPOWER CALCULATION

1. Graphic Method of Calculation

The total horsepower (TSHP) required at the drive shaft to drive the loaded conveyor system may be calculated graphically by use of the nomographs, pages 24 and 25. The friction horsepower (FHP), determined with the first nomograph, added to the Material Horsepower (MHP), determined with the second nomograph, equals the Total Shaft Horsepower (TSHP).

Friction Horsepower — A straight edge placed at the first two known values, conveyor size (related to hanger bearing class as listed in hanger bearing factor table) and length, will intersect a reference point on the centerline. A straight edge placed from this reference point to the third known value, conveyor speed, will intersect the unknown value, Friction Horsepower, on the last line.

Material Horsepower — A straight edge placed at the first two known values, conveyor capacity and Material Horsepower Factor, will intersect a reference point on the centerline. A straight edge from the reference point to the third known value, conveyor length, will intersect the unknown value, Material Horsepower, on the last line.

2. Calculation by Equation

TSHP may also be calculated by equation using the following formulas:

1. FRICTION H.P. CALCULATION

$$FHP = \frac{DF \times HBF \times L \times S}{1,000,000}$$

2. MATERIAL H.P. CALCULATION

$$MHP = \frac{CFH \times W \times MF \times L}{1,000,000}$$

OR

$$MHP = \frac{CP \times MF \times L}{1,000,000}$$

NOTE If calculated Material Horsepower is less than 5 it should be corrected for potential overload. The corrected horsepower value corresponding to the calculated Material Horsepower will be found on the lower scale of the Material Horsepower Overload Correction Chart, page 23

3. TOTAL SHAFT H.P. CALCULATION

$$TSHP = FHP + MHP^*$$

*Corrected if below 5 HP.

NOTE The actual motor horsepower required to drive the loaded conveyor system is dependent on the method used to reduce the speed the motor to the required speed of the conveyor. Drive losses must be taken into consideration when selecting the motor and drive equipment.

EQUATION SYMBOLS

TSHP	=	Total Shaft H.P.
FHP	=	Friction H.P. (H.P. required to drive the conveyor empty)
MHP	=	Material H.P. (H.P. required to move the material)
L	=	Conveyor Length
S	=	Conveyor Speed
DF	=	Conveyor Diameter Factor
HBF	=	Hanger Bearing Factor
CFH	=	Conveyor Capacity
W	=	Weight per cu. ft.
CP	=	Capacity, lbs. per hr.
MF	=	Material H.P. Factor (From the Materials Table)

CONVEYORS WITH MODIFIED FLIGHTS

The procedure for calculation of horsepower for conveyors with special or modified flights is identical to that used for standard conveyors except that the Material Horsepower must be multiplied by one or more of the following applicable factors.

MODIFIED FLIGHT FACTORS

Flight Type	Conveyor Loading			
	15	30	45	95
Cut Flight	1.1	1.15	1.2	*
Cut & Folded Flight	*	1.5	1.7	*
Ribbon Flight	1.05	1.14	1.20	*

*Not Recommended

CONVEYORS WITH PADDLES*

Factor	Paddles Per Pitch			
	1	2	3	4
	1.29	1.58	1.87	2.16

* Std. paddles at 45° reverse pitch

Total Shaft Horsepower (TSHP) is calculated by adding Material Horsepower, multiplied by the appropriate modified flight factor or factors, to Friction Horsepower.

NOTE Conveyors which have deviation in pitch only do not require special consideration, and their horsepower calculations are as described for standard conveyors.

EXAMPLE

A 10-inch conveyor 35 feet long with a capacity of 10 tons per hour at 45 RPM has been selected.

From the Materials Table, a Horsepower Factor of 0.8 is found for the material to be conveyed. The table also indicates Series 4 hanger bearings and shafts. Hard iron bearings and hardened coupling shafts have been selected to suit this requirement.

Friction Horsepower, the horsepower required to drive the conveyor empty, is calculated as follows:

Diameter Factor = 37
 Hanger Bearing Factor = 4.4
 Length = 35
 RPM = 45

$$FHP = \frac{37 \times 4.4 \times 35 \times 45}{1,000,000} = 0.256$$

Material Horsepower, the horsepower required to move the material, is calculated by the following equation:

Capacity (in lbs. per hr.) = 20,000
 Horsepower Factor = 4.4
 Length = 35
 RPM = 45

$$MHP = \frac{20,000 \times 0.8 \times 35}{1,000,000} = 0.560$$

Since the calculated Material Horsepower is less than 5, it is necessary to find the corrected horsepower value corresponding to 0.56 horsepower on the Overload Correction Chart below. This value is found to be 1.320 horsepower.

Total Shaft Horsepower (TSHP) is the sum of Friction horsepower and the corrected Material Horsepower. Thus TSHP is calculated as follows:

$$TSHP = 0.256 + 1.320 = 1.576 \text{ H.P.}$$

Assuming a drive efficiency of 85% resulting in a total drive horsepower of 1.853, a standard 2 horsepower motor would be selected for the drive input.

The horsepower required for the above conveyor may also be determined graphically by the use of the two horsepower nomographs. The first nomograph determines Friction Horsepower. The second determines Material Horsepower. Total Shaft Horsepower is determined by adding the two values.

CORRECTED MATERIAL H.P.

Friction Horsepower Nomograph

Material Horsepower Nomograph

TORQUE CAPACITIES

Although a given conveyor may be adequate insofar as material conveying capacity is concerned, the horsepower available to operate the system may exceed the torque capacities of standard components during overloaded or stalled conditions.

To insure adequate torque capacities without undue additional cost, means are provided in the Industrial standard series of conveyor components for more than one maximum allowable horsepower value. This is accomplished by not only a choice of power-transmitting component sizes but also of the materials of construction.

Analysis of a specific conveyor system with regard to component torque adequacy may be conveniently and quickly made by use of the two following nomographs.

CARBON STEEL CONVEYORS

The first nomograph covers carbon and high-tensile steel coupling bolts and shafts (drive and coupling) and conveyor pipe (in Schedule 40 and for high capacity, Schedule 80).

These components are listed according to their associated standard conveyor shaft diameters.

The following table lists actual nominal pipe diameters corresponding to the standard conveyor shaft diameter.

Shaft Diameter	1	1-1/2	2	2-7/16	3	3-7/16
Nominal Pipe Size	1-1/4	2	2-1/2	3	3-1/2	4

STAINLESS STEEL CONVEYORS

The second nomograph covers stainless steel coupling bolts, shafts and conveyor pipe. Coupling bolts are listed by the corresponding standard conveyor shaft diameter with which they are used.

Conveyor pipes are listed in both Schedule 40s and 80s by their nominal pipe sizes.

The pipe size selected should correspond to the standards listed for carbon steel pipe. Deviations from this standard are sometimes possible, in sectional conveyors, by the use of smaller pipe sizes (for economy) when the torque rating is adequate. This procedure requires reaming of the pipe bore for shaft insertion rather than the use of a bushing. It is recommended that requirements for such conveyors be referred to KWS's Engineering Department.

NOTE

High starting torque motors must not be used without design verification by KWS's Engineering Department.

EXAMPLE

A 12-inch carbon steel conveyor has been selected with a required shaft horsepower of 8.9 and a speed of 64 RPM. The drive to be used has an efficiency of 85%, thus requiring a drive input of 10.46 horsepower. Therefore, a 15 horsepower motor must be used. This total motor horsepower could be transmitted to the conveyor components if overloaded or stalled.

Three standard shaft sizes are available for 12-inch conveyors. They are 2", 2-7/16" and 3".

A straight edge is placed from 15 horsepower on the left scale to 64 RPM on the center scale. Project the straight line to the left vertical line of the chart at the right. A horizontal line from this point will pass through component groups suitable for the torque.

For the conveyor under consideration, it is found that standard components will be adequate, with the exception of coupling bolts which must be high tensile.

DRIVE ARRANGEMENTS

KWS offers a complete line of power-transmission equipment. Local distributors provide us with a large stock inventory.

Numerous combinations and types of drives are available for screw conveyor equipment. Some of the more frequently used drives and mechanical arrangements are described below:

SCREW CONVEYOR DRIVES

A screw conveyor drive consists of a standard single or double reduction shaft-mounted speed reducer, a steel motor mounting bracket, an adapter with CEMA drilling containing shaft seals, and a removable steel shaft, all mounted on a screw conveyor trough end. The motor bracket is rigidly mounted with clearance over the trough end for easy trough cover removal without disassembling any part of the drive.

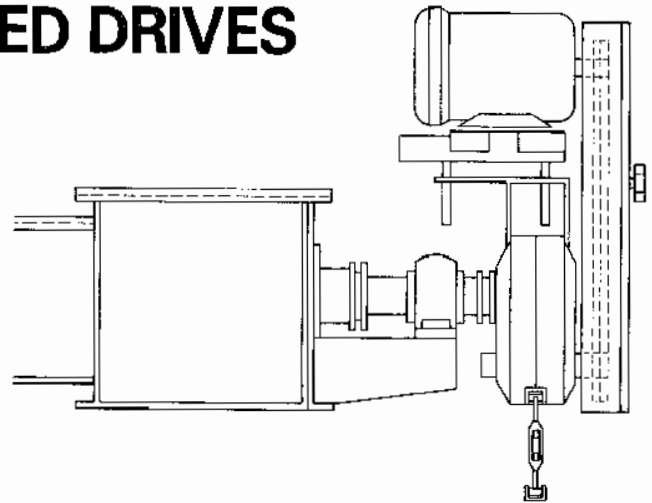

A variety of mounting arrangements makes it possible to locate the drive to avoid interference with other equipment. Correct V-belt tension can be easily maintained by simple adjustment of the motor mounting plate. The drive assembly can be quickly removed by removing the bracket mounting bolts.

SHAFT MOUNTED DRIVES

The helical gear shaft mount speed reducer uses the screw conveyor drive shaft as an "output shaft," making a mounting base and low speed coupling unnecessary. Because it does not mount to the trough end it offers several advantages. It can be used in limited, higher temperature applications where damaging heat can be dissipated before it affects the reducer. You have a greater variety of seals and bearings to choose from. You can utilize heavy duty bearing for higher than usual bearing loads. The reducer can be rotated in any position around the shaft.

V-belt tension is maintained in the same manner as the screw conveyor drive when using the adjustable motor mount. A tie-rod turnbuckle locks the shaft-mounted reducer into position. (We believe this is best accomplished in the field, consequently we do not normally support the tie-rod from the conveyor.)

COMBINATION MOTOR-REDUCER

Integral motor-reducer drives consist of a combination motor and speed reducer which may be mounted directly to the conveyor cover with an adapter base. The motor-reducer may also be mounted in other positions, depending on available space and accessibility.

The motor-reducer output shaft is connected to the conveyor drive shaft through roller chain and sprockets. Speed changes in the field are possible by replacement of one or both sprockets. Suitable conveyor drive end bearings are required for the overhung sprocket loads.

OTHER DRIVES

Other drive equipment which may be required includes variable speed units which allow manual or automatic adjustment of conveyor capacity by speed deviation. Such drives are especially useful for regulating the flow of material into a process.

NOTE

Fluid, pneumatic or resilient couplings may be used for starting heavily loaded conveyors and to prevent drive component damage due to heavy intermittent overloads.

KWS BELT GUARDS

Our belt guards are custom designed to meet your specific requirements. They are O.S.H.A. approved and will accent the best of drives.

Our two piece construction provides you with the best available features. The back panel is designed to be securely supported. The front panel with sides is easily removable by loosening a hand knob. This permits complete access to sheaves, bushing and V-belts.

Standard Features

- Painted O.S.H.A. yellow enamel
- Slotted for belt adjustment
- 16 ga. steel construction
- Fully enclosed
- Safe — rounded ends

R —Driver, $\frac{1}{2}$ " P.D. + 2"

CD —Center Distance

SH —Shaft Diameter + $\frac{1}{2}$ "

R_1 —Driver, $\frac{1}{2}$ " P.D. + 2"

W —Longest Hub + 2" (min 4") SH_1 —Shaft Diameter + 1"

SCREW FEEDERS

1. Inlet opening matches bin or hopper discharge.
2. Shroud cover prevents material flooding.
3. Twin tapered, variable pitch Screw Conveyor permits even draw off of material.
4. Twin tapered trough. Also available with drop bottom feature.
5. Discharge opening.
6. Solid shafting transmits rotary motion to driving gears.
7. Driving gears synchronize the action of the screw conveyors.

Normally short in length, Screw Feeders are designed to regulate the volumetric rate of material flow from a hopper, bin or storage unit.

The inlet is usually flooded with material (100% load capacity) but by incorporating changes in the construction of the flighting (diameter, pitch, etc.) and the speed of the feeder screw, the material discharge can be governed to the desired rate. Feeders can be built with variable diameter or stepped pitch or both in units composed of one, two or a multiple number of screws (i.e., Live Bottom Bin) depending on the application.

Screw Feeders are normally equipped with a shroud (curved) cover for a short distance beyond the inlet

opening. This prevents flooding of the conveyor with material. When handling very freely flowing materials, extended shroud covers, tubular housing construction or short pitch flights are occasionally required for positive control.

Screw Feeders with uniform diameter and pitch normally convey the material from the rear of the inlet opening first. To draw off material evenly across the full length of the inlet, a tapered screw or stepped pitch conveyor screw is required. While Screw Feeders are available in many designs to fit your particular requirements, several commonly used types are described below.

MULTIPLE DIAMETER FEEDER

This is a combination feeder and conveyor and the physical dimensions are variable on each. The small diameter feed end will operate at a full cross sectional load. When the material reaches the larger section, the cross sectional load will be at a controlled safe maximum.

SHORT PITCH FEEDER

This is also a combination feeder and conveyor. The short pitch end will handle full cross sectional loads. The material is then discharged into the standard section where the cross sectional load is reduced to the required maximum by the increase in screw pitch.

VARIABLE PITCH TWIN-TAPERED FEEDER

This feeder is popularly used to unload bins or hoppers at a controlled rate. The feed opening under the bin is designed large enough to prevent material bridging and accepts materials uniformly across the length and width of the opening. This eliminates dead areas in the bin and reduces the chance of material bridging or spoiling.

LIVE BOTTOM FEEDER

Designed for use on straight sided bins, this feeder is composed of a number of feeder screws in tandem which serve as the bottom of the bin. Material is, therefore, drawn out equally from the full width. The Live Bottom Feeder is used to its best advantage on materials which tend to pack or bridge easily.

SCREW FEEDER CAPACITY

The capacity table on pg. 20 shows Screw Feeder Capacities in cubic feet per hour per RPM. This table relates to full pitch or standard conveyors only. Shorter pitch flighting will convey a capacity in direct ratio to the capacity of the full pitch. For instance, a 9" conveyor with standard pitch (9") flighting on a 2-1/2" standard pipe, will convey 16.8 cu. ft./hr./RPM.

The same conveyor, but with 3" pitch, will convey 1/3 this amount, or 5.6 cu. ft./hr./RPM. The capacity figure is theoretical. Actual capacity will often vary due to variation in head of material in the bin and variation in material characteristics.

SCREW FEEDER SPEED

The speed of the feeder screw can be determined by dividing the desired capacity in cu. ft./hr. by the figure found in CAPACITY TABLE. For maximum efficiency, feeder screw speeds should be slower than standard screw conveyor speeds and allowances must be made for slippage of the material in the screw.

Factors Affecting the Design Of A Screw Feeder

1. The material class
2. The material physical characteristics

3. The capacity required
4. Material factor "F"
5. Weight of material resting on the Feeder Screw
6. The dimensions of the feeder opening..

In designing a Screw Feeder, virtually every situation is unique in one respect or another. For this reason, we recommend that you consult KWS Engineering Department for proper recommendations concerning your particular needs.

INCLINED SCREW CONVEYORS

Screw Conveyors can be operated with the flow of material inclined upward. When space allows, this is a very economical method of elevating and conveying. It is important to understand, however, that as the angle of inclination increases, the allowable capacity of a given unit rapidly decreases.

A standard Screw Conveyor inclined 15° upward will carry 75% of its rated horizontal capacity. At an inclination of 25°, a standard conveyor may only handle 50% of its horizontal capacity. These are estimated figures and will vary with the characteristic of the material being handled. Inclined Screw Conveyor capacities can be increased over short distances, if no intermediate hangers are required.

Other aids in conveying on an incline are the use of shorter than standard pitch and/or tubular housings or shrouded conveyor trough covers. Very often it becomes necessary to use high speed to overcome the tendency of material to fall back.

The above aids are resorted to in order to overcome the tendency of a screw conveyor to become less efficient as the angle of incline increases. Vertical conveying by Screw Conveyor, on the other hand, is quite successful and it remains that a 45° incline or angles approaching this figure, are the most difficult on which to achieve successful conveying.

Additional power is needed to convey on an incline. This added power is a function of the power required to lift the material. Judgment and experience in the art of conveying are required.

CONVEYOR SCREWS

SECTIONAL FLIGHT SCREW CONVEYORS

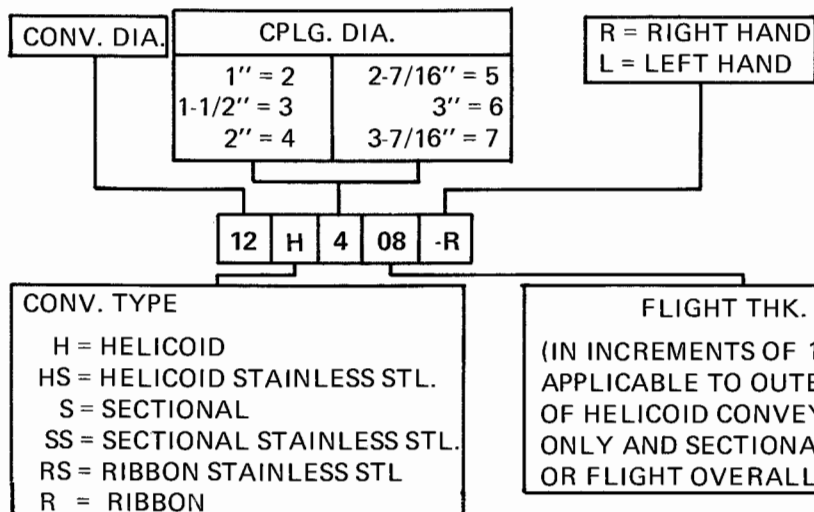

Each flight is blanked from a steel plate, formed into a helix and then butt welded together. Sectional flights are formed with a lead longer than their pitch to assure a tight gripping action along the pipe. The flights are then normally fastened to the pipe by intermittent welds and welded steel end lugs. They may be continuously welded on either one or both sides. The pipe has seamless internal collars in each end to accommodate the shafts. Sectional Flight screw conveyors are available in special diameters, thicknesses, pitches, and pipe sizes. They also can be obtained in stainless steel, Monel, brass, copper and other metals.

HELICOID SCREW CONVEYORS

Cold rolling of special analysis strip steel into a continuous helix produces a work-hardened, smoothly finished fighting surface. Helicoid fighting is of superior strength with its diameter, pitch and thickness closely controlled. The fighting is then normally fastened to the pipe by intermittent welds and welded steel end lugs. Or they may be continuously welded on either one or both sides. The pipe has seamless internal collars inserted in both ends of the pipe to accommodate the shafts. Helicoid and Sectional fighting of the same diameter and shaft size are interchangeable. Helicoid fighting of special diameters and pipe sizes can be furnished upon request.

BASIC CONVEYOR FLIGHT AND PITCH TYPES

STANDARD PITCH, SINGLE FLIGHT

Conveyor screws with pitch equal to screw diameter are considered standard. They are suitable for a wide range of materials in most conventional applications.

TAPERED, STANDARD PITCH, SINGLE FLIGHT

Screw flights increase from $\frac{1}{3}$ to full diameter. Used in screw feeders to provide uniform withdrawal of lumpy materials. Generally equivalent to and more economical than variable pitch.

SHORT PITCH, SINGLE FLIGHT

Flight pitch is reduced to $\frac{3}{4}$ diameter. Recommended for inclined or vertical applications. Used in screw feeders. Shorter pitch retards flushing of materials which fluidize.

SINGLE CUT-FLIGHT, STANDARD PITCH

Screws are notched at regular intervals at outer edge. Affords mixing action and agitation of material in transit. Useful for moving materials which tend to pack.

HALF PITCH, SINGLE FLIGHT

Similar to short pitch, except pitch is reduced to $\frac{1}{2}$ standard pitch. Useful for vertical or inclined applications, for screw feeders and for handling extremely fluid materials.

CUT & FOLDED FLIGHT, STANDARD PITCH

Folded flight segments lift and spill the material. Partially retarded flow provides thorough mixing action. Excellent for heating, cooling or aerating light substances.

LONG PITCH, SINGLE FLIGHT

Pitch is equal to $1\frac{1}{2}$ diameters. Useful for agitating fluid materials or for rapid movement of very free-flowing materials.

SINGLE FLIGHT RIBBON

Excellent for conveying sticky or viscous materials. Open space between flighting and pipe eliminates collection and build-up of the material.

VARIABLE PITCH, SINGLE FLIGHT

Flights have increasing pitch and are used in screw feeders to provide uniform withdrawal of fine, free-flowing materials over the full length of the inlet opening.

STANDARD PITCH WITH PADDLES

Adjustable paddles positioned between screw flights oppose flow to provide gentle but thorough mixing action.

DOUBLE FLIGHT, STANDARD PITCH

Double flight, standard pitch screws provide smooth, regular material flow and uniform movement of certain types of materials.

PADDLE

Adjustable paddles provide complete mixing action, and controlled material flow.

L - Left Hand Flight

HEAVY DUTY SECTIONAL FLIGHTS

RIGHT HAND SHOWN

Available in right hand or left hand.

Heavy-duty flighting is cold formed from steel up to two inch thick in a special process to obtain uniform stresses to assure long life, accuracy in diameter and

pitch. Conveyor flighting is based on 24" pitch - other flight pitches are available or can be fabricated on special order.

KWS QUICK-KEY

QUICK DISCONNECT FOR ALL SCREW CONVEYORS

Our Quick-Key option now allows you to quickly perform conveyor screw repairs or replacement without the inconvenience and time-consuming task of dismantling your entire conveyor. Available on all of our conveyor screw models, the Quick-Key is usually supplied on one end only; however, screw sections with Quick-Key on both ends can be provided when specific applications require them.

The Quick-Key is bolted to the end of the screw pipe with coupling bolts. A complete screw section may be disconnected by unbolting the clamping key and hanger, allowing the section to be lifted out without disturbing the rest of the conveyor.

To replace the section simply bolt the Quick-Key and hanger into place and you're back in business . . . with minimum down-time and loss of production. You also eliminate the need for removing the conveyor drive unit with a Quick-Key on the screw pipe attached to the drive . . . saving even more of your valuable time.

To order a screw conveyor with the Quick-Key disconnect add the suffix "QK1" or "QK2." For example:

For a Helicoid Conveyor Screw with a diameter and pitch of 9"; a flight thickness of $\frac{3}{16}$ " tapered to $\frac{3}{32}$ "; a right hand flight and a standard 9'10" length; the number is

9H306-R-9-10 (see page 51)

To indicate Quick-Key option for one end of screw only, the number would be:

9H306-R-9-10-QK1

When ordering "QK1" the Quick-Key will be on the Drive End (Discharge End) of the screw unless specified otherwise.

To indicate Quick-Key disconnectors for both ends of the screw, the number would be:

9H306-R-9-10-QK2

Remove coupling bolts . . .

Lift conveyor screw out to perform necessary repairs or to replace . . .

Replace the conveyor screw and bolt the Quick-Key in place.

SPLIT FLIGHT COUPLINGS AND SHAFTS

Split flight couplings consist of a pipe or tubing of appropriate inside and outside diameters, split longitudinally and jig-drilled for coupling bolts, with a half flight of heavy gauge material continuously welded on both sides of each half. Use of split flight couplings permits installation or removal of individual conveyor screws without disturbing adjoining sections or hangers. Quick-removable conveyor screws also permit the removal of individual conveyor screw sections without disturbing other sections. Regular couplings and coupling bolts are used with these screws.

Have dimensions certified for installation purposes. Coupling bolt are not included. Coupling shafts No. 6 and No. 7 can be furnished with bearing length K hardened.

Shaft No. 5 drilled standard for conveyor screw coupling bolts or

one end only. Holes for the split flight coupling bolts on other end must be drilled in assembly to insure alignment of flight.

Orders covering split flight couplings with conveyor screws and assembled shafts, for Shaft No. 5, use the drilled price.

Add Suffix "D" to part No. if Drilled. Example: SFC41-5SD.

KWS HARD-SURFACED SCREW CONVEYORS

KWS hard-surfaced screw conveyors are designed to eliminate excessive wear on flights while handling abrasive materials. An alloy is permanently fused to the carrying side (of a width in relation to the cross-sectional load, see chart) of the flighting face.

ADDITIONAL TYPES OF ABRASION RESISTANT SCREW CONVEYORS AND ACCESSORIES

If desired, screw conveyors may be furnished in abrasion resistant metals, such as 40/50 carbon, T-1, nickel steel, A.R. Plate from 210 to 460 Brinell or may be coated with Stellite, Hardex, Airco, etc.

When handling abrasive materials, consideration should be given to protecting screw conveyor accessories. Hardened couplings, outboard bearings, trough ends and hangers with white iron or hardened surface bearings can be furnished. Troughs of heavy abrasion resistant metals are also available.

Notes: Other hard surfaces available upon request.
Consult KWS Manufacturing Co., Inc.

CONVEYOR SCREWS – SPECIAL

WEAR SHOES

High carbon steels capable of heat treatment, or abrasion resistant alloys are used to an ever increasing extent as materials for flights. CONSULT FACTORY FOR DETAILS.

CORROSION-RESISTANT CONVEYOR SCREWS

Corrosion is manifested in so many different ways that no one choice of material will suit all requirements. To withstand the effects of corrosion encountered in many fields of industry, conveyor screws are fabricated of stainless steel, copper, brass, bronze, nickel, monel, corten, aluminum, and other materials.

Galvanizing, tinning, chrome plating and other coating methods have proved effective under mildly corrosive conditions. Vulcanized or bonded rubber covering of the entire conveyor is frequently satisfactory for resistance to extremely corrosive action.

HEAT-RESISTANT CONVEYOR SCREWS

Conveyor screws for high temperature applications are made of many of the available heat-resistant alloys. Several of the stainless steels and other high-chrome alloys are particularly suitable for this service.

NON-SPARKING SCREW CONVEYORS

Screw conveyors are available for use in areas which

require a non-sparking composition. Metals, such as aluminum, brass, copper or bronze and certain stainless steel analyses are normally used for this application. Caution should be exercised in the selection of other components as well.

Detachable hardened flight segment

Detachable hardened flight segments, or wearing sunk bolts to the conveyor shoes, bolted with counter-flights are preferred in many applications for quick and easy replacement.

Rubber covered screw

Rubber covering with its inherent tough resilience, bonded or vulcanized to a conveyor screw, offers excellent abrasion-resistant properties.

SPECIAL SCREW CONVEYOR WELD FINISHES

Specifications on screw conveyor occasionally include the term "grind smooth" when referring to the finish on welds. This specification is usually used for stainless steel, but occasionally it will appear in carbon steel specifications as well.

"Grind smooth" is a general term and subject to various interpretations. This section establishes K.W.S. recommended classes of finishes, which should be used to help you find the class required for an application.

- 1A — Weld Spatter and Slag removed (CEMA I)
- 1B — Weld Spatter and Slag removed and Sand Blasted
- 2A — Weld Spatter and Slag removed and rough grind welds to remove heavy weld ripple or unusual roughness (equivalent to a 40-50 grit finish) (CEMA II)
- 2B — Weld Spatter and Slag removed and rough grind welds to remove heavy weld ripple or unusual roughness (equivalent to a 40-50 grit finish) and sandblasted
- 3A — Weld Spatter and Slag removed and medium grind welds — leaving some pits and crevices (equivalent to a 80-100 grit finish) (CEMA III)
- 3B — Weld Spatter and Slag removed and medium grind welds — leaving some pits and crevices (equivalent to a 80-100 grit finish) and sandblasted
- 4 — Weld Spatter and Slag removed and fine grind welds — no pits or crevices permissible (equivalent to a 140-150 grit finish) (CEMA IV)
- 5 — Weld Spatter and Slag removed and fine grind weld — no pits or crevices permissible (equivalent to a 140-150 grit finish) and polish to a bright uniform finish (CEMA V)

CONVEYOR SCREW COMPONENTS

END LUGS

End lugs are manufactured of heavy-gauge steel. They are designed to provide maximum support with the least obstruction of material flow. They are welded securely to both flight and pipe. Manufactured for both right or left hand conveyors for intake or discharge ends of the conveyor.

INTERNAL COLLARS

KWS internal collars are manufactured from special seamless tubing. Close-tolerance collars are pressure-inserted in the pipe end by means of a special fixture and plug-welded for maximum efficiency and service life. Coupling bolt holes are jig-drilled for perfect alignment. Replacement collars are furnished undrilled and should be drilled to match in the field.

STD. COUPLING BOLTS

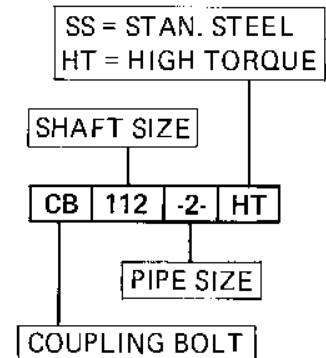

Coupling bolts are manufactured from special-analysis steels. Bolts have short thread length designed especially for use with conveyor screws. Each bolt is furnished with special type lock nut. Bolts are manufactured to close tolerances for perfect fit in coupling bolt holes. They are designed for maximum torque capacities and service life.

SHAFTS

Coupling shafts are designed to transmit rotation between individual conveyor screw sections and to provide intermediate radial support through hanger bearings. Two basic types are available: Standard shafts, for use with hanger bearings, and close-coupling shafts, designed for applications where the omission of hanger bearings is desirable. Cautions should be exercised in the use of close-

coupling shafts to prevent deflection. KWS coupling shafts are manufactured of cold-drawn C-1045 medium-carbon steel which has an average tensile strength of 112,000 psi. Stainless shafts with an average tensile strength of 100,000 psi., are available in several types, including 303 and 316. All coupling bolt holes are jig-drilled for perfect alignment.

† THESE BEARINGS ARE DRILLED AND TAPPED FOR GREASE PIPE AS STANDARD.

HANGER POCKET

Hanger bearing support for conveyors with tubular housings is accomplished by means of a hanger pocket mounted on top of the housing at hanger bearing points. The hanger bolts to the straight sides of the pocket. Any standard hanger designed for inside mounting may be used. The pocket is sealed by a quick access cover with weather-proof, turned-down edges. It may be gasketed for dust-tight operation. Standard pockets are of the same gauge as the housings to which they are fitted.

NO. 660

The No. 660 hanger is designed to mount on top flanged troughs. Supplied with a dust tight sealed ball bearing, this hanger has a 4° shaft alignment compensation and is operable in a temperature range up to 240°. This hanger is fitted with a lubrication fitting.

NO. 670

Basically the same hanger bearing design and availability as the No. 660, the 670 is used where flush mounting is necessary to permit dust proofing or weather sealing conveyor housings.

NO. 370

The No. 370 hanger also has the thermal expansion feature of the No. 316 hanger, but is supplied with a ball bearing assembly similar to the No. 660 and 670 hangers.

NO. 220

Designed for high capacity conveyors, the No. 220 hanger is a low profile hanger and bearing housing allowing minimum flow obstruction.

NO. 226

The No. 226 hanger incorporates all the advantages of the No. 220 but is designed for inside flush mounting with the trough top flange.

NO. 326

Designed for flush inside mounting, the No. 326 hanger has the same self adjusting assembly as the No. 316. Available only with hard iron or hard surfaced bearings. Hardened or hard surfaced shafts are required.

NO. 230

No. 230 hangers are designed for top mounting on trough flanges. The bearing and assembly frame are for heavy duty applications and are interchangeable with the No. 216 and 316 top frames.

NO. 216

The No. 216 hanger is an inside flush mounted hanger recommended for use in heavy duty or high abrasion applications, especially where dust proofing is necessary.

NO. 316

The No. 316 hanger provides the ruggedness of the No. 216 hanger bearings and the flexibility of the 326 hanger mounting brackets. The mounting bracket is self adjusting to compensate for thermal expansion of components in high heat situations.

TROUGH ENDS

All KWS trough ends are manufactured to very close tolerances from quality heavy gauge steel. All assembly and mounting holes are jig drilled to insure correct alignment with housing end flanges. Housings are also available in stainless steel.

Ball bearings are standard with trough ends, however, ends may also be ordered with roller or babbit bearings or without any bearings.

Standard trough ends are furnished in six basic types, most of which are available for U or flared trough and tubular or rectangular housings.

TROUGH ENDS WITHOUT FEET

Support is provided by separate flange foot or saddle.

TROUGH ENDS WITH FEET

End manufactured with an integral bottom flanged foot.

OUTBOARD BEARING ENDS

Components for bearing and seal or double bearing arrangements. An integral pedestal supports the pillow block bearing.

FLUSH DISCHARGE ENDS

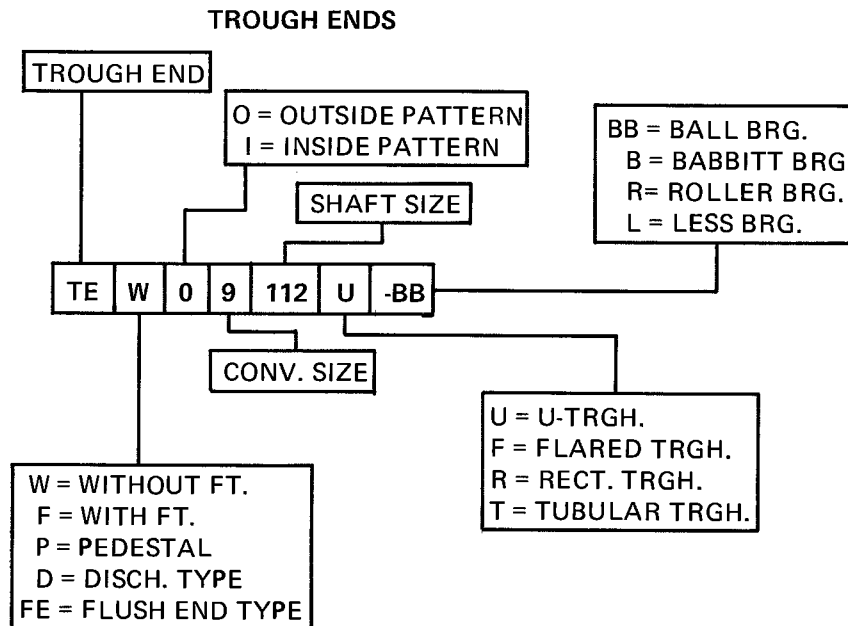

Primarily for use with flush end discharges, the bottom of ends are jig drilled for standard discharge flange pattern.

DISCHARGE ENDS

Designed to allow discharge directly from trough end.

INSIDE TROUGH END

Manufactured for inside assembly, this end supplies support, and the standard trough flanges must be omitted.

THRUST UNITS

Thrust Washers

Thrust washers are intended for light thrust loads at the intake end of the conveyor. Precision steel washers transfer the conveyor load through a bronze washer to the conveyor end with a minimum of friction.

Provision should be made for frequent lubrication of this bearing and it is not recommended for conveyors carrying abrasive materials.

Thrust Collar

Thrust collars are intended for service similar to the thrust washer assembly at the discharge end of the conveyor.

A specially grooved shaft is fitted with a split iron set collar to transfer the thrust load through a bronze washer to the conveyor end bearing.

Since this unit is installed outside the conveyor, it may be used when conveying abrasive materials.

Type RTB Roller Bearing

Type RTB roller bearing thrust units provide an economical anti-friction combination bearing for medium to heavy thrust loads.

This unit is unidirectional in thrust loading together with relatively great radial capacity. A separate seal plate is provided for the protection of the bearing from the conveyed material. This plate may be reversed to prevent contamination of the material. This bearing is furnished with a drive shaft, or end shaft.

SEALS

PLATE SEAL

The plate seal is an economical, effective sealing device designed for exterior mounting between the end bearing and the conveyor housing end. Standard units include lip-type seals, but other types of commercial seal cartridges may also be used. The plate seal and the end bearing are attached by means of common bolts. The plate may also be attached independently when outboard bearing ends are used.

SPLIT GLAND SEAL

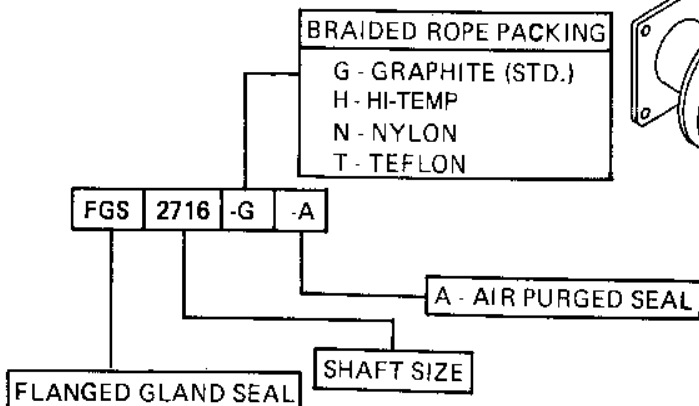

This unit, designed for interior or exterior mounting, provides an effective seal by compression of the packing. Packing pressure may be adjusted by means of two exposed nuts at the top half of the seal housing.

WASTE PACK SEAL

This universal type seal is designed for use with waste packing or cartridge-type lip or felt seals. An opening at the top of the housing facilitates waste repacking. The packing material is partially exposed for oiling. The waste pack seal is mounted outside between the end bearing and the conveyor end. It may also be mounted independently for use with the outboard bearing end.

FLANGED GLAND SEAL

The flanged gland seal is a highly effective means of sealing the conveyor both internally and externally. This seal also is suitable for pressure or vacuum service. Mechanical compression of the packing material is accomplished by means of three compression bolts. Designed for use with outboard bearing ends. Also available in an air purged type.

5-7/16	FGS5716*	11-1/2	9	5/8	1/2	50

*Specify packing G-Graphite, H-Hi-Temp, N-Nylon, T-Teflon, Add suffix "A" for air purged seal.
We supply Graphite packing as our standard.

CONVEYOR TROUGHS

All KWS conveyor troughs are available in stainless steel. All troughs may also be furnished hot-dipped

galvanized. For specific alloy materials available, consult the Engineering Department.

Angle Flange

U-TROUGH

The most commonly employed U-trough is the angle-flanged type. The top flange is fabricated with heavy-duty structural steel angles welded flush with the top trough edge. End flanges are jig-welded to insure proper alignment with other trough sections.

Formed Flange

The top flange is formed from the same sheet as the trough, resulting in a lightweight, yet rigid, housing section. End flanges are jig-welded for perfect alignment with other sections.

Double Formed Flange

The top flange of the double-formed flange trough is also formed from the same sheet as the trough, and its unique design adds considerable strength and rigidity to the trough. The double-formed flange provides an effective dust-tight seal when used in conjunction with the flanged-type covers and appropriate gasket material.

Channel

The channel U-trough is well suited for applications requiring long distances between conveyor supports. Upper trough sides are fabricated with structural steel channels to which the lower contoured section may be bolted or spring clamped. Useful for abrasive applications where frequent replacement of the lower formed section is anticipated.

Drop Bottom

Intended for applications where quick, convenient access to the conveyor interior is required, the drop bottom trough consists of rigid upper side channels to which a lower contoured section is attached. One side of the lower formed section is hinged while the other is attached by use of spring clamps or other type of quick-opening device.

Dust Seal

Dust seal conveyor troughs are produced with a continuous channel pocket extending along the sides and across the ends of each trough section. Special covers are required having formed flanges which project down into the channel pockets. After installation, sand, grease, the material being conveyed or other materials are placed in the channed pockets to effect an efficient dust seal.

Formed Channel

The formed channel U-trough is well suited for applications requiring long distances between conveyor supports. Upper trough sides are fabricated with formed steel channels to which the lower contoured section may be bolted or spring clamped. Useful for abrasive applications where frequent replacement of the lower formed section is anticipated.

Jacketed

For application on jacketed conveyor troughs consult KWS Engineering Department.

Formed Flange

FLARED TROUGH

Intended primarily for sticky or slightly viscous materials, the flared trough is most often employed with ribbon conveyors. Top flanges are formed from the same sheet as the housing. End flanges are jig-welded for perfect alignment with other sections.

TUBULAR HOUSINGS

Standard

Tubular housings are inherently dust and weather-tight, rigid and may be readily loaded to a full cross section. The standard tubular housing is rolled from a single sheet and continuously welded at the seam.

Angle Flange

Angle flanged tubular housings consist of semi-circular formed halves, each of which includes an angle flange of structural steel. The two sections are bolted together to form the tubular housing.

Formed Flange

This type is similar to the angle flanged except that the flanges are formed from the same sheet as that of the contoured half sections, thus resulting in a rigid, lightweight tubular section. The halves are bolted together to form the complete housing.

RECTANGULAR

Angle Flange

Formed Flange

Rectangular conveyor troughs are particularly applicable to the conveying of abrasive materials since conveyed material tends to form its own trough by sliding over the static material in the bottom and corners of the trough thus protecting it from severe wear.

These troughs may be fabricated from one sheet with formed top flanges, or angle top flanges; they may also be constructed with each side and bottom flanged and bolted.

DISCHARGE SPOUTS

Fixed

Discharge spouts are shop welded to the conveyor trough.

Gauges are proportioned to the size and material thickness of troughs.

Fixed – Flat Slide

Fixed discharge spouts are available with hand slide gate assemblies.

The slide gate assemblies are bolted to the discharge flange and may be assembled for either side or longitudinal opening. Slide gates are fabricated from the same gauge as the discharge spout.

Flush End Discharge Spout

This spout is designed for use at the final discharge point. The end of the spout is comprised of a housing end with bottom flange drilled with standard discharge flange bolt pattern. Because it is located at the extreme end of the conveyor, there is no carryover of material past the final discharge point. The flush end arrangement eliminates the unnecessary extension of trough and interior components beyond the actual discharge point.

RACK AND PINION GATES

KWS rack and pinion slide gates are manufactured from heavy gauge steel and incorporate cut steel rack and pinion gears for smooth, effortless operation.

Other outstanding features include standard flanged ball bearing handwheel shafts and adjustable gates.

COVERS

FLANGED COVERS

Flanged covers are turned down approximately 3/4" on each side. Flanges provide a limited degree of weather and dust proofing and also may be gasketed for more complete dust or non-critical weather-proof operation. They are secured by means of bolts or screw or toggle clamps.

FLAT COVERS

Flat covers fit flush with housing top flanges. They may be bolted, spring clamped or attached with screw or toggle clamps. Although flat covers are intended primarily for interior applications, they also may be gasketed for moderate dust-proof operation.

SEMIFLANGED COVERS

Semiflanged covers are intended for indoor or general use. Cover edges are slightly flanged to make it more rigid. A butt-strap is provided at one end which overlaps the succeeding cover section to cover the joint between sections. Covers may be fastened to the trough flange with spring, clamps, screw clamps or toggle clamps.

HIP ROOF COVERS

Ridged or hip roof covers are designed for outside applications. The center peak of the cover sheds rain or snow. Both sides of the cover are flanged to provide additional weather-proofing. These covers also may be gasketed for more severe weatherproof operation. Covers may be bolted or attached by means of screw or toggle clamps.

SHROUD COVER

The shroud cover is designed for use with standard U-trough when a tubular cross-section is required. Standard covers frequently are used with the shroud cover to prevent accumulation of foreign matter or moisture in the pockets formed by the contour of the shroud and the sides of the housing.

DUST SEAL COVER

Dust seal covers are flanged down on all four sides to match channel sections fabricated in the special dust seal troughs.

Channels may be filled with sand or other materials to provide the desired seal effect.

Clamps

SPRING CLAMP

KWS steel spring clamps are manufactured from heavy-gauge steel with precision dies. Clamps are of the pivot type and are attached to the conveyor housing top flange by means of rivets. Designed for attaching flat covers, the spring clamps are adjustable and may be used with covers having rubber or other types of gaskets.

SPRING CLAMP

SCREW CLAMP

Steel screw clamps may be used with flanged or flat covers for all conveyor sizes through 24". Screw clamps provide a simple, yet completely secure, means of attaching covers.

SCREW CLAMPS

TOGGLE CLAMP

Toggle clamps are designed for attaching covers to conveyors where quick accessibility is required. The toggle clamp is attached by welding the front or top of the base to the conveyor. The hold-down bar moves a full 90° to clear the working area. Adjustable spindle allows adjustment for all conveyor sizes. Plastic handle moves 50°. The clamp provides a holding pressure of 800 lbs., yet weighs less than a pound.

TOGGLE CLAMPS

HEAVY-DUTY SWIVEL SCREW CLAMP

DEPENDABLE AND DURABLE. Our KWS-SP-SC swivel screw clamps are ideal for a multitude of applications. These heavy-duty clamps are constructed from stainless steel and aluminum for durability and years of corrosion-resistant service.

VERSATILE. Our heavy-duty swivel screw clamps are perfect for many material handling applications. On drop bottom troughs they provide dependable holding power with a minimum number of clamps. Of course, they are ideal for securing trough covers too.

CONVENIENT. Quick and easy access is provided by our swivel screw clamps.

Under laboratory test conditions 17.5 lbs. ft. torque applied results in a compressive load of 1,560 lbs. without failure.

TROUGH COVER - Accessories

OVERLOAD RELIEF

In the event that storage facility, processing equipment or subsequent conveyors become full, the material is forced upward against the hinged relief and discharged, thus preventing overload damage to the conveyor and accessories.

Relief doors are available for bolting to existing conveyor covers or may be shop assembled to any type of standard or special conveyor cover. Length "L" is equal to 1-1/2 times the conveyor diameter.

OVERLOAD RELIEF WITH SWITCH

This protective device provides immediate relief upon overload and closes or opens an electrical circuit which may stop the conveyor, sound an alarm, or both.

The electrical switch is available in standard, weather tight or explosion proof construction. This assembly is available for installation on existing conveyors, or may be shop assembled during fabrication of new conveyors. Length "L" is equal to 1-1/2 times the conveyor diameter.

When the surplus of material flows from the conveyor the overload relief closes and returns the switch to safe position, thus restarting the conveyor.

OVERLOAD PRESSURE SWITCH

When it is undesirable to allow material to spill from the above relief devices during overload, this pressure type switch may be installed on the discharge spout to open or close an electrical circuit which may stop the conveyor, sound an alarm, or both.

This device may also be used to advantage in any intermediate discharge spouts to indicate a full condition or to open another pneumatically operated discharge gate. Switches are available for field installation on existing conveyors, or may be shop assembled during fabrication of new equipment.

INSTALLATION AND MAINTENANCE

KWS'S SCREW CONVEYOR SYSTEMS MAY BE FURNISHED AS COMPLETE ASSEMBLIES OR IN INDIVIDUAL COMPONENTS. SHOP ASSEMBLED SYSTEMS ARE ALIGNED AND MATCH MARKED FOR EASE OF ASSEMBLY IN THE FIELD. THESE UNITS ALSO INCLUDE ALL NECESSARY HARDWARE INCLUDING BOLTS. INDIVIDUAL COMPONENTS SHOULD BE MORE CAREFULLY ASSEMBLED TO INSURE PROPER ALIGNMENTS FOR THE MOST EFFICIENT OPERATION.

NOTE: UPON DELIVERY OF CONVEYORS, CHECK SHIPMENT WITH PACKING LIST TO BE SURE ALL COMPONENTS ARE PRESENT AND NOT DAMAGED. IF DAMAGE HAS OCCURRED IN TRANSIT, A CLAIM SHOULD BE FILED WITH THE CARRIER IMMEDIATELY.

ASSEMBLY

- PLACE THE CONVEYOR HOUSING SECTIONS IN THEIR PROPER SEQUENCE, USING MATCH MARKS OR DRAWING. CONNECT THE END FLANGES LOOSELY. DO NOT TIGHTEN BOLTS. ALIGN AND LEVEL THE HOUSING BOTTOM CENTERLINES PERFECTLY, THEN TIGHTEN FLANGE BOLTS. **NOTE:** A CONVEYOR ASSEMBLY SHOULD ALWAYS BEGIN AT THE THRUST END. IF THE SYSTEM DOES NOT REQUIRE A THRUST BEARING UNIT, ASSEMBLY SHOULD BEGIN AT THE DISCHARGE END.
- IF THRUST END IS DESIGNATED, ASSEMBLE THE HOUSING END PLATE AND THRUST BEARING.
- INSERT THE END OR DRIVE SHAFT IN THE BEARING. DO NOT TIGHTEN SET SCREWS.
- PLACE THE FIRST CONVEYOR SCREW SECTION IN THE HOUSING, SLIPPING THE END OR DRIVE SHAFT INTO THE CONVEYOR PIPE END. SECURE WITH COUPLING BOLTS.

IMPORTANT - THE SUPPORTING LUGS ON THE FLIGHTING SHOULD BE OPPOSITE THE MATERIAL CARRYING SIDE OF THE FLIGHTS. CLEARANCE IS REQUIRED BETWEEN THE HOUSING ENDS AND THE CONVEYOR PIPE ENDS. ALSO, BE SURE THE CONVEYOR SCREW CLEARS THE BOTTOM OF THE HOUSING BY 1/2".

- INSERT COUPLING SHAFT INTO THE OPPOSITE END OF THE FIRST SCREW SECTION. TIGHTEN COUPLING BOLTS.
- INSERT COUPLING SHAFT THROUGH HANGER BEARING AND BOLT HANGER TEMPORARILY TO THE HOUSING.

CAUTION - BEFORE BOLTING EACH HANGER BEARING IN PLACE, FORCE ALL ASSEMBLED SCREWS AWAY FROM THE DISCHARGE END. THIS REMOVES ALL "SLACK" DUE TO COUPLING BOLT HOLE CLEARANCE AND PLACES THE CONVEYOR SCREW SECTIONS LONGITUDINALLY IN THE POSITION THEY WOULD ASSUME UNDER FULL THRUST LOAD DURING OPERATION. THIS IS PARTICULARLY IMPORTANT IN LONG CONVEYORS TO PREVENT THE SCREW PIPE FROM CONTACTING HANGER BEARINGS AND TRANSFERRING THRUST LOADS THAT WOULD RESULT IN EARLY FAILURE. A MINIMUM CLEARANCE OF 1/3" MUST BE ALLOWED BETWEEN THE CONVEYOR PIPE END AND THE HANGER BEARING ON THE SIDE NEAREST THE CONVEYOR DISCHARGE. SOME USERS PREFER TO ALLOW CLEARANCE ON THE INLET SIDE BY MOVING THE HANGER TOWARD THE INLET END WITH ONLY FREE RUNNING CLEARANCE BETWEEN THE HANGER BEARING AND PIPE END. REVERSIBLE CONVEYORS SHOULD HAVE CLEARANCE BETWEEN THE HANGER BEARING AND PIPE ENDS DIVIDED EQUALLY ON EACH SIDE. FOR CONVEYORS SUBJECT TO HIGH TEMPERATURE MATERIALS, EXPANSION TYPE HANGERS SUCH AS No. 326 SHOULD BE USED.

- TIGHTEN END BEARING SET SCREWS FIRMLY AGAINST THE FIRST END OR DRIVE SHAFT.
- TIGHTEN THE FIRST HANGER BOLTS. BE SURE THAT THE HANGER IS AT RIGHT ANGLES TO THE HOUSING.
- INSERT A COUPLING SHAFT IN THE SECOND CONVEYOR SECTION AND SECURE WITH COUPLING BOLTS. ATTACH THE OPPOSITE END TO THE COUPLING SHAFT IN THE FIRST SCREW SECTION. SECURE WITH COUPLING BOLTS. BE SURE TO ALLOW THE 1/32" CLEARANCE BETWEEN THE HANGER BEARING AND THE PIPE END OF THE SECOND SECTION AFTER FORCING THE SCREW SECTIONS TOWARD THE INLET END.
- REPEAT THE PRECEDING STEPS FOR EACH CONVEYOR SCREW SECTION.
- INSERT THE FINAL END OR DRIVE SHAFT INTO THE LAST SCREW SECTION AND ATTACH COUPLING BOLTS.
- ATTACH THE HOUSING END AND END BEARING TO THE SHAFT AND BOLT THE END TO THE HOUSING.
- LUBRICATE BEARINGS IF REQUIRED.

CAUTION - TO INSURE THERE IS NO BINDING OR MISALIGNMENT IN THE SYSTEMS, ROTATE THE CONVEYOR SLOWLY BY HAND. IF THE SYSTEM IS TOO LARGE TO TURN BY HAND, APPLY POWER ONLY MOMENTARILY AND CHECK CONVEYOR THOROUGHLY.

MAINTENANCE - LUBRICATION - SCREW CONVEYOR SYSTEMS UTILIZE MANY DIFFERENT DESIGNS OF BEARINGS; THEREFORE, LUBRICATION REQUIREMENTS MAY VARY FOR DIFFERENT SYSTEMS. BALL AND ROLLER BEARINGS SHOULD BE LUBRICATED TO MANUFACTURER'S LUBRICATION STANDARDS. BABBITT OR OTHER TYPE FRICTION BEARINGS SHOULD BE LUBRICATED PERIODICALLY. THE FREQUENCY OF LUBRICATION SHOULD BE BASED ON CHARACTERISTICS OF MATERIAL BEING HANDLED, AS WELL AS THE OPERATING CONDITIONS. OIL IMPREGNATED BRONZE, GRAPHITE-IMPREGNATED BRONZE, OIL IMPREGNATED WOOD, HARD IRON, HARD SURFACED AND MANY TYPES OF PLASTIC BEARINGS REQUIRE NO PERIODIC LUBRICATION.

INSPECTION - A PERIODIC INSPECTION OF THE CONVEYOR SYSTEM IS RECOMMENDED TO INSURE PROPER OPERATION. CHECK FOR EXCESSIVE WEAR, DAMAGED OR MISALIGNED COMPONENTS. THE CHECK SHOULD INCLUDE INTAKE AND DISCHARGE POINTS FLIGHTING THICKNESS AT THE OUTER EDGE, BEARING CONDITION AND ALIGNMENT OF SHAFTS. DRIVE SHAFTS ARE SUBJECT TO THE INITIAL LOADS OF THE CONVEYOR; THEREFORE, IT IS RECOMMENDED THAT COUPLING BOLTS BE REMOVED PERIODICALLY TO INSPECT FOR ELONGATION OF BOLT HOLES AND BENT OR WORN BOLTS.

KWS MANUFACTURING CO., LTD.

KWS BUCKET ELEVATORS

Centrifugal discharge bucket elevator

Positive discharge bucket elevator

Continuous bucket elevator

Centrifugal discharge bucket elevators PRICED UPON REQUEST

Elevators of this design predominate in the bulk handling of free-flowing, fine and loose materials with small to medium size lumps. Buckets, mounted at spaced intervals, are loaded by scooping up material from the boot or by feeding the material into them. Material is discharged by centrifugal action as the buckets pass over the head wheel. These elevators are made in several types and are suitable for many requirements.

KWS 100 • Elevators of this type meet the service requirements of the majority of installations using centrifugal discharge elevators. The head shafts are fixed. The foot shaft takeups are of the screw type. Gravity takeups are available. Buckets are of malleable iron for use on chain or belt. Casings are of steel plate and angle construction. (Fabricated Steel Buckets are also available)

KWS 200 • These elevators are similar to KWS 100 except that the head shafts are adjustable and the foot shafts are fixed to maintain the relation of buckets to the loading chute and curved bottom plate. They are preferred for handling food products, materials which tend to pack or build up in the bottom of the boot, and for materials having a considerable percentage of lumps.

KWS 500 • These elevators are designed and engineered to conform with general practice in the handling of grain. Head and foot shafts are provided with anti-friction bearings. Takeups are of the screw type unless otherwise specified. Buckets are of steel and are mounted on a belt. Casings of steel are welded and dust tight. The curved hood is designed for proper discharge of the grain. The boot can be loaded from the front or back side or both. Venting of the head and boot sections is desirable to improve the pickup and discharge of materials. (Heavy Duty Polyethylene buckets or Fabricated Steel Buckets are also available)

Positive discharge bucket elevators PRICED UPON REQUEST

Elevators of this design operate successfully at low bucket speeds and are suitable for handling light, fluffy and fragile materials and those having a tendency to stick in the buckets. Buckets, mounted at spaced intervals, are loaded by scooping up material from the boot or by feeding the material into them. After passing over head wheels, the buckets are inverted over the discharge spout, thus providing a positive discharge of material.

KWS 600 • This design conforms with the best practice for handling and discharging materials which are light, friable or sluggish. The head shafts are fixed. The foot shaft takeups are of the screw type. Gravity takeups are available. Buckets are of malleable iron mounted at intervals on double strands of chain. Casings are of steel plate and angle construction.

Continuous bucket elevators PRICED UPON REQUEST

Elevators of this design are made in a number of types for handling many bulk materials ranging from light to heavy and from fines to large lumps. Buckets are spaced continuously and loaded by direct feeding, except for KWS 800 elevator where material is scooped from the boot. Spillage between buckets is prevented by their close spacing. As buckets discharge, the material flows over the preceding bucket, whose front and projecting sides form a chute, to the discharge spout.

KWS 700 • This elevator is the most frequently used of the continuous bucket design. The head shafts are fixed. The foot shaft takeups are of the screw type. Gravity takeups are available. Buckets are of steel and spaced continuously on a single strand of chain. Casings are of steel plate and angle construction. Material is fed to the buckets through a loading leg.

KWS 800 • Elevators of this type are used for the handling of fine or crushed materials with lumps not exceeding ½ inch. These elevators are similar to KWS 700, except that head shafts are adjustable and foot shafts are fixed, to maintain the relation of buckets to the loading chute and curved bottom plate. Buckets are loaded by scooping up material from the boot. When modified by the addition of a loading leg and a correspondingly higher inlet spout, this type elevator can be used for handling lumpy materials.

KWS 800L • Identical to KWS 800, except with loading leg and stub inlet chute.

KWS 1000 • This elevator is of the super-capacity type and used for handling friable, heavy or abrasive material ranging from fines to large lumps. The head shafts are fixed and the foot takeups are of the screw type. Gravity takeups are available. Continuous buckets are end-mounted between two strands of Class SS bushed roller chain. Material is fed to the buckets through a loading leg. Casings are of steel plate and angle construction. Inclined boots are recommended when handling sharp, wedge-shaped and shale-like materials.

KWS 1100 • These elevators are similar in design to KWS 1000, except for greater capacities and centers. Head terminal machinery and driving equipment are carried on independent supports. The foot takeups are of the screw type. Gravity takeups are available.

KWS 1400 • This elevator is designed primarily for cement mill service, but is suited for many other similar abrasive service applications. Their design and rugged construction makes them ideally suited for handling cement, clinker, crushed stone, bauxite, feldspar, gravel, gypsum, roofing granules, sand, shale, etc. They are available in a full range of sizes extending to the very high capacities and lifts.

K.W.S. HI-CAPACITY CENTRIFUGAL DISCHARGE BUCKET ELEVATOR

Designed with quality components to meet industry's need for maximum efficiency and dependable service. Designed for various operations . . . from grain elevators to manufacturing . . . to processing plants. A leader in the handling of free flowing, fine and loose material with some small to medium size lumps.

Standard components consisting of:

12 gauge head section with 14 gauge split removable hood, ¼" thick discharge spout with adjustable throat and inspection port, head shaft C-1045 steel, pillow Block roller bearings with split housing, split gland seals with graphite packing K.W.S. heavy duty drum pulley.

10 gauge boot section with curved bottom plate and two removable panels and two clean out doors, ¼" thick inlet hopper with flange, boot shaft C-1045 steel, K.W.S. heavy duty ball bearing take-up, split gland seals with graphite packing, K.W.S. heavy duty wing pulley.

12 gauge intermediate sections with 3/16" thick flange angles and vertical angles (outside at each corner), first intermediate section to have one access door and one removable panel, gasket to be 1/8" thick closed cell black neoprene sponge, all assembly bolts to be zinc plated.

Head section and boot section will be shop assembled, (complete elevator not assembled).

Belting—PVC—polyester polyvinyl chloride.

Buckets—"Heavy Duty" Polyethylene style CC-HD. (-60 degrees F to +225 degrees F)

KWS MANUFACTURING COMPANY, LTD.
GENERAL TERMS AND CONDITIONS
Form #TC0603-9

TERMS OF PAYMENT: All invoices are due and payable in Johnson County, TX. To customers having established credit with KWS, terms are 1/2% discount if paid in full within ten (10) days of the date of invoice and otherwise all credit sales are due in full within thirty (30) days from the date of invoice, unless otherwise agreed in writing. No discount is allowed for earlier payment unless authorized by KWS in writing. Purchasers without a credit rating will avoid delay by furnishing satisfactory references or by instructing KWS to bill in advance or to ship with sight draft attached to bill of lading. Accounts past due shall accrue interest at the highest lawful rate allowed by applicable law.

LIMITED WARRANTY: KWS warrants all equipment manufactured by KWS to be free from defects in material and manufacture at the time of shipment for a period of one (1) year from the date of shipment. KWS will furnish without charge, but will not install, replacements for such parts as we find to have been defective. Unless otherwise stated in quotation, this limited warranty is based on operation of the equipment for a period not exceeding eight hours per day. KWS MAKES NO OTHER WARRANTY OF ANY KIND AND HEREBY DISCLAIMS ALL WARRANTIES EXCEPT THE LIMITED WARRANTY HEREBY STATED, BOTH EXPRESS AND IMPLIED, INCLUDING THE WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. All warranty claims must be submitted within ten (10) days of discovery of defects or shall be deemed waived. No representative of our company has any authority waive, alter, vary or add to the terms hereof without prior approval in writing. This limited warranty applies only to equipment which is subjected to normal use and service. This limited warranty shall not apply to any equipment which as been subjected to misuse, neglect or accident, or has been altered or tampered with, or if corrective work has been done thereon without our specific written consent, no allowances will be made for such corrective work done without such consent. Improper lubrication, deterioration by chemical action, and wear caused by the presence of abrasive materials, do not constitute defects. KWS shall not be responsible for work done, apparatus furnished, or repairs made by others. Equipment manufactured by others, and included in our proposal is not warranted in any way by KWS but carries only the manufacturer's warranty, if any.

LIMITATIONS OF LIABILITY: It is expressly understood that KWS's liability is limited to the furnishing of replacement parts. KWS SHALL NOT BE LIABLE, UPON WARRANTIES OR OTHERWISE, FOR ANY SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES FOR ANY DAMAGES ARISING FROM THE USE OF EQUIPMENT. Thus, KWS is not liable for any other expense, loss or damage including, but not limited to, loss of profits, production, increased cost of operation of spoilage arising in connection with the sale or use of, or inability to use our equipment or products for any reason, except as herein provided.

TEXAS LAW TO APPLY, JURISDICTION AND VENUE: It is expressly understood that this sale of products or equipment was negotiated, executed, consummated and is otherwise performable in Johnson county, Texas, and shall be governed, construed and interpreted as to validity, enforcement and in all other respects in accordance with the laws of the State of Texas, and the laws of the United States of America, as applicable. KWS has its principal place of business in Johnson County, Texas, which county shall be the proper place of venue to enforce payment or performance. Purchasers irrevocably agree that any legal proceeding arising out of or in connection with this sale shall be brought in the state courts of Johnson County, Texas, or the United States District Court for the judicial district in which Johnson County is located.

PROMISE OF DELIVERY: Promise of delivery represents only our best estimate of the time required to complete the work and ship the material from our plant. All orders are accepted with the understanding that shipping dates are approximate and subject to change because of factory conditions, fires, strikes, material shortages, civil or military authority, mandatory priority and/or other causes beyond our knowledge or control.

CANCELLATION: Orders entered on our books are not subject to cancellation and no cancellations will be accepted except upon terms that will INDEMNIFY us against loss. Cancellation charges as published will be invoiced.

RETURNED GOODS: No material will be accepted for credit unless such return is first authorized in writing by us. All prices are predicated on sale of material as merchandise only. Additional charges may be assessed for any special services or markings, special boxing, cartage, transfer, overtime (when authorized by purchaser), financing, or other abnormal requirements.

MINIMUM CHARGE: Minimum charge on any invoice will be \$35.00 net plus applicable parcel post, express or freight charges.

CONTRACTS: All prices are made F.O.B. Burleson, Texas, unless otherwise indicated. Our responsibility ceases when delivery has been made to the transportation company. If there are shortages or evidence of damage, insist on the transportation agent making notations on the shipping documents before signing receipt. Claims should be made immediately and we will cooperate with customers when desired in obtaining adjustments from the transportation company. All contracts are made and accepted at Burleson, Texas, and are not valid until acknowledged from the company's main office. It is the company's intent and purpose to surrender title to this material when final payment is made. Possession may be given before final payment is due, and to protect us against default in payment or in the event of an execution or attachment is levied on your property, it is hereby expressly agreed:

A-The title and right of possession to this material shall remain with us until full and final payment is made; B-No part of this material shall be considered a fixture or incorporated into the realty by virtue of its attachment to real estate and any part may be separated from such real estate for the purpose of re-possession by us or by our agents in the event of a default by purchaser; C-We shall have the right to elect a claim of mechanic's lien against the property upon which this material is situated and waive our rights to re-possess under Paragraphs A and B above any time before expiration of the time fixed by law for filing a mechanic's lien; D-Acceptance or acknowledgement of any order, quotation or contract is with the express understanding that a "no lien agreement" has not been filed.

SPECIAL TAXES: Any federal, state or city sales tax or other manufacturers' or processors' tax, if any when assessed, will be added to our invoice.

CLAIMS: Claims for errors or shortages existing prior to our delivery of the equipment to the carrier will be considered only when made to use immediately after receipt of shipment.

SAFETY DEVICES: We will supply only such safety devices as are specified in this order. Any additional safety measures or devices which may be required by law, or which you wish to add, are to be furnished by you or, at your written request, they will be furnished by us as additional cost to you.

PAINTING: As a protective measure, we will apply before shipment one coat of our standard shop paint to all outside accessible unfinished surfaces, and a protective coat to all machine-finished surfaces, or equal.

ELEVATOR BUCKETS

Welded Steel Construction *For Chains or Belts*

What's so special about KWS MANUFACTURING ?

Take a look. KWS is setting the standard of excellence for the material handling industry. From a complete system to a replacement part - KWS delivers. You expect that standard of excellence from KWS MANUFACTURING. We demand it.

KWS MANUFACTURING CO., LTD

ELEVATOR BUCKETS

Style "A"

Style "AA"
(with reinforcing strip)

SALEM

STYLE A FABRICATED STEEL ELEVATOR BUCKETS, are commonly used for elevators handling cement, chemicals, coal, sand, gravel, stone, pulp, phosphate and similar materials. Ends are parallel and perpendicular to back of bucket.

STYLE AA FABRICATED STEEL ELEVATOR BUCKETS, are similar to the Style A, with reinforcing lip along the front edge and around the front corners, giving the buckets greater resistance to distortion when scooping up heavy or gritty materials. Ends are parallel and perpendicular to back of bucket.

SALEM FABRICATED STEEL ELEVATOR BUCKETS, are used for handling granular or powdered, free-flowing materials. They are formed to a shape which insures proper filling and free and clean discharge. Ends are parallel and perpendicular to back of bucket.

Style "AC"

Style "C" (square heel)

SUPER CAPACITY

STYLE AC FABRICATED STEEL ELEVATOR BUCKETS, are designed to provide fast thorough discharge of cement, lime and other dry, fluffy materials. Vent holes in the bottom of each bucket release trapped air in filling and allow material to empty from bucket quickly and completely on discharge.

STYLE C FABRICATED STEEL ELEVATOR BUCKETS, are designed for handling clay, sugar, salt, finely pulverized ores, wet grain, and such other materials as would stick or pack in other styles of buckets. Ends are parallel and perpendicular to back of bucket.

SUPER CAPACITY BUCKETS, are of the continuous type, extend back of the pitch line of the chain and result in a much greater carrying capacity for each bucket than can be obtained with the regular continuous buckets. These buckets are mounted between two strands of chain. They are three piece construction, securely welded both inside and outside to assure long life and dependability.

PRICED UPON REQUEST

REINFORCING STRIP ON LIP

- Reinforcing strips securely welded to front lip of buckets.
- Furnished with or without hard surfacing rod on leading edge. (OPTIONAL)
- Reinforcing strips on Salem & Style "A" type buckets will be approximately six (6) inches longer than buckets to wrap around & protect front corners.
- Reinforcing strips on continuous type buckets will be furnished on inside or outside of lip to customers specs.
- Reinforcing strips of abrasive resistant steel or other alloys will be quoted promptly on request.

PRICED UPON REQUEST

Strip wraps around corners

OPTIONAL
Hard surface rod
on leading edge

DRAG- MASTER CONVEYORS

En-Masse conveying for compact, efficient, high-volume delivery.

The compact En-Masse is an efficient, high-performance alternative to conventional means of material handling.

Because it conveys a high volume of material, yet requires much smaller amounts of space, the En-Masse is an ideal solution for congested areas where several units are discharging in the same location.

Material is moved as a large "solid" mass with no internal turbulence, at low speeds, using 85% of the trough for material. The resulting high capacity and lack of turbu-

lence allows the En-Masse to handle almost all types of bulk materials, including fragile types many other conveyors cannot handle well.

This high-performer uses $\frac{2}{3}$ the horsepower of an equivalent, conventional unit. It is weather- and dust-free, and can be self-cleaning, depending on materials.

Talk to our sales engineers about ways the En-Masse can be the compact solution to your materials delivery problems.

KWS MANUFACTURING COMPANY, LTD.

SAFETY INSTRUCTIONS

MINIMUM GENERAL PROVISIONS

It is the responsibility of the contractor, installer, owner and user to install, maintain and operate the conveyor and/or elevator components and conveyor assemblies manufactured and supplied by KWS Manufacturing Company, Ltd. in such a manner as to comply with the Williams-Steiger Occupational Safety and Health Act, and with all state and local laws and ordinances and the American National Standards Institute Safety Codes as currently in effect.

In order to avoid an unsafe or hazardous condition, the assemblies or parts must be installed with the following **MINIMUM** provisions:

1. Conveyors and/or elevators shall not be operated unless the conveyor and/or elevator housing completely encloses the conveyor's and/or elevator's moving elements; and power transmission guards are in place. Conveyor and/or elevator inlets and discharge openings are designed to connect to other equipment or machinery so that the flow of material into and out of the conveyor and/or elevator is completely enclosed. If the conveyor and/or elevator is to be opened for inspection, cleaning or observation, the motor driving the conveyor and/or elevator is to be locked out electrically in such a manner that it cannot be restarted by anyone, however remote from the area, unless the conveyor and/or elevator housing has been closed and all other guards are in place. A formalized Lockout/Tagout procedure must be followed when a conveyor and/or elevator are stopped for maintenance or repairs and before conveyor and/or elevator guards are removed. All safety devices, covers, and guards should be replaced before restarting equipment for operation and eliminating the Lockout/Tagout.
2. If the conveyor and/or elevator must have an open housing as a condition of its use and application, the entire conveyor and/or elevator is then to be guarded by a railing or fence.
3. Feed openings for shovels, front-end loaders, or other manual or mechanical equipment shall be constructed in such a way that the conveyor and/or elevator opening are covered by grating. If the nature of the product is such that grating cannot be used, then the exposed section of the conveyor and/or elevator is to be guarded by a railing, or fence, and there shall be warning signs posted.
4. DO NOT walk on conveyor and/or elevator covers, grating, or power transmission guards.
5. DO NOT poke or prod material in the conveyor and/or elevator with a bar or stick.
6. DO NOT place hands or feet in any conveyor and/or elevator openings.
7. DO NOT overload conveyor and/or elevator or use it for anything but its intended use.
8. Practice good housekeeping.

HAZARDOUS OPERATION

Standard conveyors and/or elevators are not equipped to operate under conditions, which may be hazardous, nor with hazardous materials. The manufacturer should be consulted if there is an indication that a hazardous condition or material is involved. Several situations may create these conditions. A few of the more common follow:

1. Hazardous Condition - Where product is under pressure or vacuum, or the trough is provided with jackets for heating or cooling; special precautions are required. Standard components are not designed for this service.
2. Hazardous Materials - they may be explosive, flammable, toxic, noxious, etc. Special provisions for safety are required. DO NOT use standard components.
3. Handling Food Stuffs - Conveyors and/or elevators to handle foodstuffs are subject to special codes for materials, construction, location and accessibility. Investigation before ordering conveyors and/or elevators is required. KWS Manufacturing Company, Ltd. is capable of providing you with help in this area. Special precautions should be taken for protection of personnel against contact with moving parts when utilizing quick clean out features in sanitary conveyors and/or elevators.

ELECTRICAL

Conveyor and/or elevator manufacturers generally do not provide electrical equipment to control the conveyors or elevators. Many kinds of electrical interlocking of conveyors and/or elevators and conveyor and/or elevator systems are available; such that if one conveyor and/or elevator in the system or process is stopped, other equipment feeding it or following it can be automatically stopped. The purchaser must use electrical equipment conforming to the National Electric Code, the National Electric Safety Code and other local or national codes.

Electrical controls, machinery guards, railings, walkways, arrangement of installation, training of personnel, etc., are necessary and mandatory ingredients for a safe working place. It is the responsibility of the contractor, installer, and owner/user to supplement the materials and services furnished by KWS Manufacturing Company, Ltd. with necessary items to make the conveyor and/or elevator installation comply with all laws and codes.

Consideration should be given to some or all of the following electrical devices, and to any others that may be appropriate. All devices, such as those listed below, may enhance the safety and/or overall performance of the equipment in certain situations. Consideration must be given to their use as a secondary safety device as they may present a false sense of security to the operator and/or personnel around the equipment. In no case are they intended to replace or reduce the importance of the Lockout/Tagout procedures required by law as the primary safety precautions. In addition, consideration must be given to the feasibility and usefulness of secondary safety devices in each specific working environment.

1. Overload protection devices such as shear pins, torque limiters, etc. to shut off power whenever operation of conveyor and/or elevator is stopped as a result of excessive material, foreign objects, excessively large lumps, etc.
2. No speed protection devices such as zero speed switches to shut off power in the event of any incident that may cause conveyor and/or elevator to cease operating.
3. Safety shut out switch with power lockout provisions at the conveyor drive.
4. Emergency stop switches readily accessible wherever required.
5. Electrical interlocking power lockout provisions to shut down feeding conveyor and/or elevator whenever receiving conveyor and/or elevator stops.
6. Electrical devices to warn personnel of startup of conveyor and/or elevator, especially if started from remote location.
7. Special enclosures for motors and controls for hazardous atmospheric conditions.
8. Electrical interlocking switches to shut down conveyor and/or elevator are NOT recommended for covers, inspection doors, personnel repair opening with covers, etc. due to the false sense of security these devices give operators and maintenance personnel.

SAFETY LABELS

One or more safety decals (several samples illustrated on the following page) are attached to all conveyor and/or elevator housings, gates, guards, etc. For complete details of decal to use and its location on the equipment, refer to Conveyor Equipment Manufacturers Association (C.E.M.A.) at www.cemanet.org.
